

Fairy Lake Slope to the West Side of the lake

Date

Fri, 02/05/2021 - 16:00

Activity

Snowmobiling

Observed natural avalanche at Fairy Lake when we snowmobiled to the lake today. Avalanche appeared to be naturally occurring. The crown was roughly 150ft wide varying from 2.5-.5ft deep. I took these pictures in passing on my snowmobile. The large part of the crown appeared to be on the new snow interface however some of the slide appeared to be a glide as it ripped down to the rocks on the face. I did not expose myself for long enough to get a very clear read on the slide other than that. The section where the crown broke deep did not travel very far. There is still notable amounts of hang fire. I would say the slide was r2-d2.

Region

Bridger Range

Location (from list)

Fairy Lake

Observer Name

Christian Davidson
