

Emigrant observations

Date

Sat, 04/08/2023 - 15:10

Activity

Snowboarding

We toured into Emigrants southeast bowl on Saturday. We found thin and reactive wind slabs on north facing slopes. Our ECT on a north face gave us stable results below the wind slab layer. It was the second day in a row of high temperatures and full sun but there was very little wet slide activity in this zone. We observed multiple old crowns in the surrounding mountains that looked to be a few feet thick. They were possibly breaking on a crust layer we found about 2 feet deep in our pit.

Region

Out of Advisory Area
